Abstract

Many persons like home dogs, cats and birds. They buy for them special cages, for example, large or small sometimes with trainers [1-9]. To keep the animal well we need to take a walk our dog rather for a long time. If you are an old person (woman or man) and if you have not good health and don't have enough time to realize such procedure, there is a problem which is needed to solve. But in practice sometimes we either must stay at home or make this walk very short. In this case the dog begins to acquire the additional weight in a body. Moreover, all muckles in the dog's body become too feeble. How to solve this problem correctly? There is one way to overcome this negative situation and help our dog to be strong and without any abundant weight if you are rather old and it is a difficult to have a long constitutional for a long time.

Text About the Main Reasons and the New Cage

As it has just mentioned above, to keep the dog in a good shape we must go for a walk with our alumnus minimum twice per diem (early in the morning and before the night). For all that the duration of the outing must be about one hour each time. Unfortunately, such period we can realize in practice very seldom. There are many objective reasons, namely:

- It is raining now;
- Too cold weather or/and strong wind;
- Age;
- Laziness;
- Illness;

- Tiredness;
- Have no time enough because you are busy and so on.

If we essentially reduce the common term of the walk with the dog, so much the worse we make both for us and for the animal. Any man begins to be like a weak being and the same your dog begins not only be the weak but his weight increases, a mobile is falling and a fatness is growing also.

To help your dog you can apply the special simulations/trainers (Fig. 1, for example).

Figure (1): Two versions of simulations/trainers for the dog (beg-droshky) Sometimes we use another type of trainer (**Figure 2**).

Figure (2): The ring-wheel as the trainer for the dog or cat, or squirrel

Each of these shown simulations have usually definite merits and shortcomings. But the last version doesn't use often for the dog though it reminds more the squirrel's wheel.

The new recommended cage is given below (**Fig. 3**).

Figure (3): Special cage: 1 – the main body of cage; 2 – mobile runner/track; 3 – door; 4 – niche; 5 – driving block

If the walls of this cage are made from the net (as a fender), a man can pass the lead from the dog-collar through the cell outside to manage the position of the animal in the cage. If the walls of the cage are made from the transparent and solid material, then in this case we have to make the opening in the wall for the dog-collar beforehand.

Block 5 has buttons to operate a velocity of the mobile runner (more quickly or more slowly, or stop, of course).

If the dog is tired, the animal can stand in the niche to get a rest. This stand/cage must have the instruction with recommendations what speed for the mobile runner a man must fix in accordance with the age, weight and general state of the dog.

Moreover, the upper limit of training for the dog during the time must be restricted by the automatic working principles/device.

Conclusion

So then, the new cage for the dogs is suggested and it is described in detail. It helps to support good shape and weight for a dog in a good position. It permits to strengthen both muscles and the heart of the animal. Moreover, this cage can be applied for the birds which like/prefer more often run instead of to fly.
